Test Automation Practices

A practical guide to successful adoption

Steen Brahe, Product Manager

Introduction

Steen Brahe

Product Manager

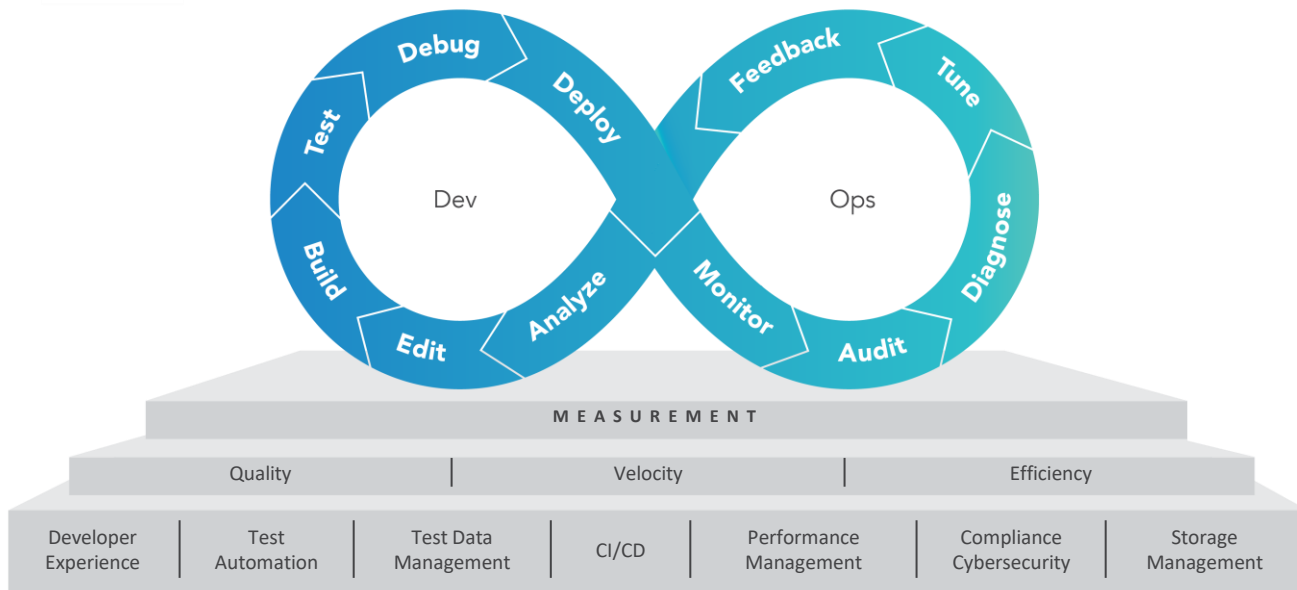

steen.brahe@compuware.com

[linkedin.com/in/steenbrahe](https://www.linkedin.com/in/steenbrahe)

- Product Manager for Compuware's Test Automation tools.
- Worked with mainframe test automation the last 18 years
- Experienced adoption challenges from the inside and the outside in many large organizations.
- Will share these experiences and will explain from adoption point of view what works and what does not work

Mainstream the Mainframe

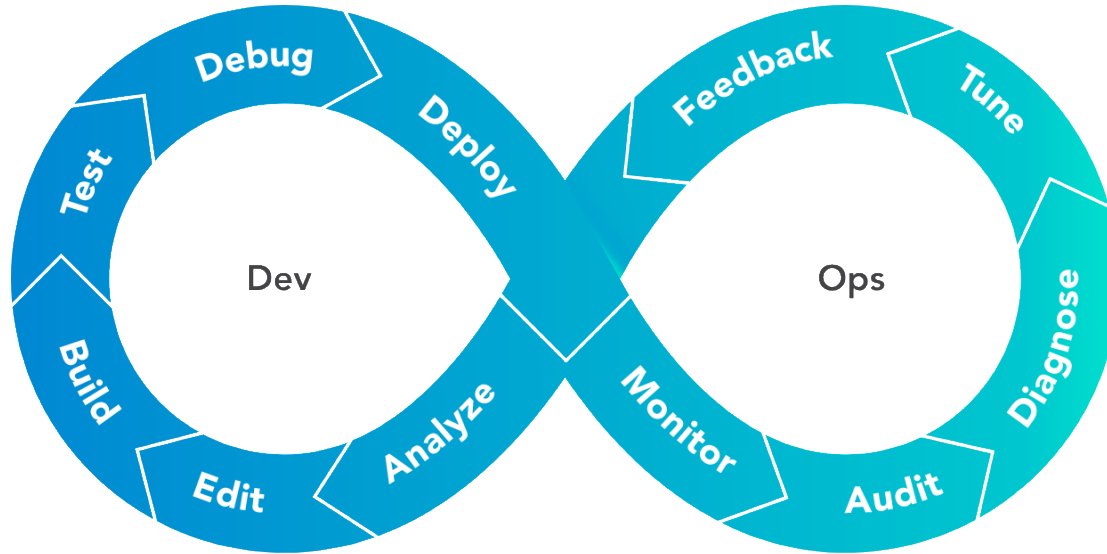

Enabling DevOps Across the Enterprise

Agenda

- Why Test Automation
- Adoption Challenges
- Best practices
- Adoption Example
- Summary

Why Automated Testing

Velocity

Deliver products faster

Quality

Ensure high quality with visibility

Efficiency

Reduce manual rework

IT Pressured to Deliver Innovation Faster

According to a recent survey of mainframe app dev managers:

- 85% of organizations find it difficult to deliver faster without compromising quality, security, customer experience and operational efficiency
- Test automation is cited as single most important factor in overcoming these risks

Research conducted by Vanson Bourne on behalf of Compuware.
Based on a global survey of 400 senior IT leaders responsible for
application development in organizations with a mainframe.

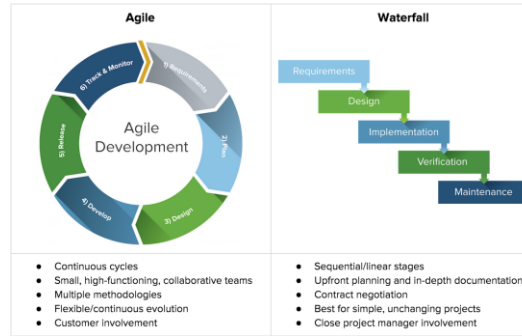

ADOPTION CHALLENGES

Adoption Challenges

Organizational Level

Engineering Practices

Using new Technology

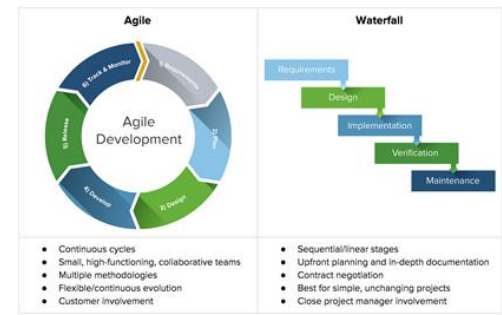

Organizational Challenges

- How do we quickly impact velocity, quality & efficiency?
- How do we change an organization to focus on automated testing as a natural part of development?
- How do we measure adoption?
- What is our current testing practice?
 - How should our future testing practice be?
- Where and how should we start?

Engineering Practices Challenges

- Where do we start to automate testing?
- What is a sufficient test of a program?
- How do we collaborate in a team?
 - How to do concurrent development?
 - How should we share test cases?
- How can we use pipeline technologies for automated test execution?
- How do we refactor programs for better testing?

Using New Technology Challenges

- How do I learn to use a test automation tool
- How to deal with relationship between program and test cases?
 - How to find relevant test cases for a program?
- How do I learn Git?

The Path to Failure!

- Big bang approach for complete development organization
- Define processes before starting development organization
- Don't involve QA in development organization
- Give developers the go-ahead to start testing
- Train all developers up front
- Don't listen to experiences from other companies

DONT DO THIS

BEST PRACTICES

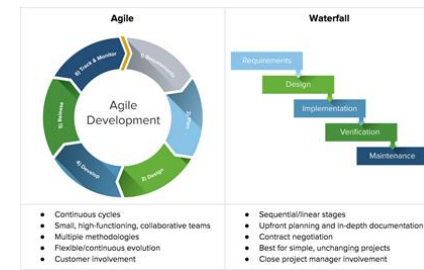

How to Adopt as an Organization

- Commitment from senior leadership
- Understand that change take time
- Start Small, Learn, Educate, Standardize, Expand
- Pick a small motivated team with a mix of young and older developers
 - Baseline: Measure velocity and bugs before adoption
 - Team follows “How to adopt test automation as a user”
 - Expect it will take some time to change habits – focus on learning in the team
 - Compare: Measure velocity and bugs after adoption
- Use the empowered and motivated team as internal advocates
- Expand to other teams
- Measure adoption

How to Adopt a Test Automation Process

- Start to establish practices and processes for the organization
 - Decide how to share test cases
 - Examine how test automation fits into other DevOps initiatives like Continuous Integration and Deployment (CI/CD)
- Establish a Test Automation Knowledge Center
- Roll out gradually to more teams
- Recognize teams success and keep motivating them
- Note:
 - Most important is to create automated test cases
 - An Automated pipeline with test execution is secondary

How to Adopt Test Automation as a User

- **Start simple, learn, then increase complexity**
 - Find a simple (Batch) program, record a test case and execute
 - Modify test case and see result
 - Move to a more complete program
 - Start using Code Coverage and use it actively to create more tests
 - Copy test case and stubs and manually edit for testing other code paths
 - Build a suite of regression tests for one or several programs
 - Understand that there are several tools in the toolbox. Different problems need different tools
- Understand different testing types
 - Positive testing, negative testing and boundary value testing
- Understand to pick the right programs for testing
- Understand Test Driven Development / Maintainence
- Use a Version Control System
 - Share test cases
 - Experiment with collaboration
- Integrate into a CI/CD pipeline
 - This might not be needed at all for individual developers

Adoption Example

Example of Successful Adoption

<https://resources.compuware.com/forrester-tei-topaz-for-total-test-lp>

Customer Shared Experiences Before and After Adopting Test Automation

Key Drivers

- DevOps transformation
- Value stream mapping identified areas of opportunity
- Manual testing was slow and error prone

Pilot Results

- 6-month pilot
- Set aspirational target for 20% improvement in developer productivity
- Actual results: 233% increase in dev productivity
- 83% decrease in bugs
- Reduced time to setup unit tests by 80%

Business Results

- Enabled DevOps culture change
- Reenergized workforce
- More work with same resources
- Virtually bug free
- Payback of initial investment <3 months
- 4-month reduction in developer ramp up time to productivity

Summary

- Automated testing enables business **agility** by improving **velocity and quality** of delivering software
- Path to Failure
 - Big bag approach
 - Dont involve developers
 - All training up front
- Path to Success
 - Start Small, Learn, Educate, Standardize, Expand
- Developer efficiency has been measured to increase **233%** while number of bugs decreased by **83%** and **ROI** of nearly **500%**
